

KH Construction GA4 & GTM Marketing Analytics Case Study

PROJECT CASE STUDY

1.PROJECT OVERVIEW

KH Construction is a small construction business website designed to generate customer enquiries through phone, WhatsApp, and email.

The goal of this project was to implement website analytics and create a marketing dashboard to understand visitor behaviour, traffic sources, engagement, and customer contact actions.

2.BUSINESS PROBLEM

The website previously had limited visibility into visitor behaviour.

The main questions were:

- How many people are visiting the website?
- Where are visitors coming from?
- Are visitors engaging with the website?
- How many visitors attempt to contact the business?
- Which contact method is used most?

The project was designed to answer these questions using Google Analytics 4 and Google Tag Manager.

3.IMPLEMENTATION

The following analytics setup was implemented:

- Google Analytics 4 (GA4) for website analytics
- Google Tag Manager (GTM) for managing tracking
- WhatsApp click tracking

- Phone click tracking
- Email click tracking
- Key Event measurement for important contact actions
- Traffic-source analysis
- Looker Studio dashboard for reporting

4.GA4 EVENT TRACKING

The website tracks important user interactions through GA4.

Events implemented include:

- whatsapp_click — tracks clicks on the WhatsApp contact button
- phone_click — tracks clicks on the phone number
- email_click — tracks clicks on the email contact option
- scroll — measures deeper engagement with the website
- page_view — measures page visits

WhatsApp, phone, and email interactions were configured as Key Events because they represent important customer enquiry actions.

5.MARKETING ANALYTICS DASHBOARD

A Looker Studio dashboard was created to bring the GA4 data into one visual report.

The dashboard includes:

- Active users
- Sessions
- Key events
- Engagement rate
- Traffic sources
- Contact actions
- Landing-page performance

6.KEY INSIGHTS

TRAFFIC SOURCES

Traffic can be compared across sources such as direct, referral, and organic traffic to understand where website visitors originate.

ENGAGEMENT

Sessions and engagement rate help evaluate whether visitors are actively interacting with the website.

CONTACT ACTIONS

WhatsApp, phone, and email clicks provide measurable indicators of potential customer enquiry intent.

LANDING PAGE PERFORMANCE

Landing-page data can be used to identify which pages attract visitors and generate engagement.

7.BUSINESS RECOMMENDATIONS

- Prioritize channels that generate engaged visitors and contact actions.
- Keep WhatsApp and phone CTAs highly visible because they provide direct enquiry opportunities.
- Use UTM parameters for future marketing campaigns to improve campaign attribution.
- Monitor contact events regularly to identify changes in customer behaviour.
- Use the dashboard to support future marketing decisions with data.

8.TOOLS USED

Google Analytics 4 (GA4)

Google Tag Manager (GTM)

Looker Studio

Google Sheets / BigQuery

9.PROJECT OUTCOME

The project transformed the website from a basic informational website into a measurable marketing asset.

The business can now track website traffic, visitor engagement, and customer contact interactions through GA4 and monitor the results through a centralized marketing analytics dashboard.

PROJECT SKILLS DEMONSTRATED

GA4 implementation, Google Tag Manager, Event tracking, Key Event measurement, Marketing analytics, Traffic-source analysis, Dashboard development, Data-driven marketing recommendations
